

**MAXIM****CMOS High Speed 8-Bit A/D Converter  
with Track/Hold Function****ADC0820****General Description**

The ADC0820 is a high speed, microprocessor compatible, 8 bit analog-to-digital converter which uses a half-flash technique to achieve a conversion time of 1.4  $\mu$ s. The converter has a 0V to +5V analog input range and uses a single +5V supply.

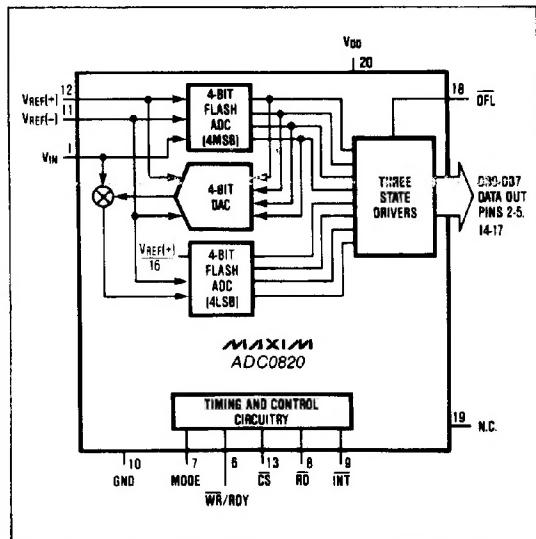

A built-in track-and-hold function is included, eliminating the need for an external track-and-hold for input slew rates up to 100mV/ $\mu$ s.

The A/D easily interfaces with microprocessors by appearing as a memory location or I/O port without the need for external interfacing logic. Data outputs use latched, three-state buffer circuitry to allow direct connection to a microprocessor data bus or system I/O port. An over-flow output is also provided for cascading devices to achieve higher resolution.

Maxim's ADC0820 is pin-compatible with National Semiconductor's ADC0820 and provides improved specifications. It is packaged in 20-pin Small Outline, DIP and CERDIP packages.

**Applications**

Digital Signal Processing  
High Speed Data Acquisition  
Telecommunications  
High Speed Servo Loops  
Audio Systems

**Functional Block Diagram****Features**

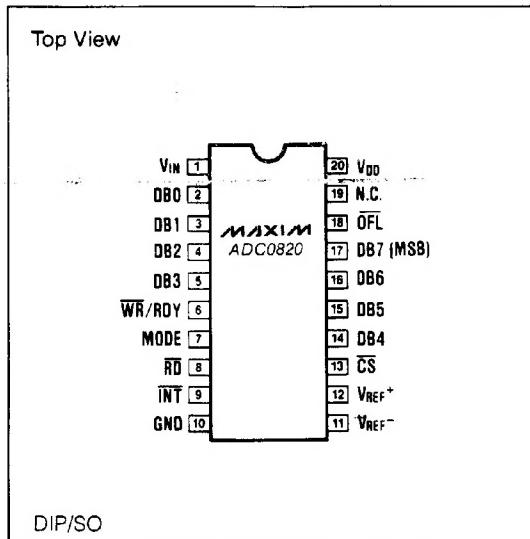

- ◆ Fast Conversion Time: 1.4  $\mu$ s Max.
- ◆ Built-in Track-and-Hold Function
- ◆ No Missing Codes
- ◆ No User Adjustments Required
- ◆ Single +5V Supply
- ◆ No External Clock
- ◆ Easy Interface To Microprocessors

**Ordering Information**

PART	TEMP. RANGE	PIN-PACKAGE	INL (LSB)
ADC0820BCN	0° C to +70° C	20 Plastic DIP	$\pm 1/2$
ADC0820CCN	0° C to +70° C	20 Plastic DIP	$\pm 1$

# CMOS High Speed 8-Bit A/D Converter with Track/Hold Function

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage, $V_{DD}$ to GND	0V, +10V	Operating Temperature Ranges	0°C to +70°C
Voltage at any other pins (Pins 1-9, 11-19)	GND - 0.3V, $V_{DD}$ +0.3V	ADC0820BC/CC	-40°C to +85°C
Output current (Pin 19)	30mA	ADC0820BJ/CJ	-55°C to +125°C
Power Dissipation (Any Package) to +75°C	450mW	Storage Temperature Range	-65°C to +160°C
Derate Above +25°C by	6mW/°C	Lead Temperature (soldering, 10sec)	+300°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect the device reliability.

## ELECTRICAL CHARACTERISTICS

Note 1: Total unadjusted error includes offset, full-scale and linearity errors.

Note 2: Sample tested at  $+25^\circ C$  by Quality Assurance to ensure compliance.

Note 3: Guaranteed by design.

Note 4: All input control signals are specified with  $t_r = t_f = 20ns$  (10% to 90% of  $+5V$ ) and timed from a voltage level of  $1.6V$ .

Note 5: Defined as the time required for an output to cross  $0.8V$  or  $2.4V$ .

Note 6: Defined as the time required for the data lines to change  $0.5V$ .

Note 7: For faster conversions use WR-RD Mode.

**ADC0820**

## CMOS High Speed A/D Converter with Track/Hold Function

### Pin Description

PIN	NAME	FUNCTION	PIN	NAME	FUNCTION
1	$V_{IN}$	Analog input; range = GND < $V_{IN}$ < $V_{DD}$ .	11	$V_{REF}^-$	Lower limit of reference span. Sets the zero code voltage. Range: GND to $V_{REF}^+$ .
2	DB0	Three-state data output, bit 0 (LSB).	12	$V_{REF}^+$	Upper limit of reference span. Sets the Full Scale Input voltage. Range: $V_{REF}^-$ to $V_{DD}$ .
3	DB1	Three-state data output, bit 1.	13	$\overline{CS}$	CHIP-SELECT input. $\overline{CS}$ must be low for the device to recognize $\overline{WR}$ or $\overline{RD}$ inputs
4	DB2	Three-state data output, bit 2.	14	DB4	Three-state data output, bit 4.
5	DB3	Three-state data output, bit 3.	15	DB5	Three-state data output, bit 5.
6	$\overline{WR/RDY}$	WRITE control input/READY status output. See Digital Interface section.	16	DB6	Three-state data output, bit 6.
7	MODE	Mode selection input. This input is internally pulled low with a $50\mu A$ current source. RD Mode: MODE low/open. WR-RD Mode: MODE high.	17	DB7	Three-state data output, bit 7 (MSB).
8	$\overline{RD}$	READ input. $\overline{RD}$ must be low to access data. See Digital Interface section.	18	$\overline{OFL}$	Overflow Output. If the analog input is greater than $V_{REF}^+$ , $\overline{OFL}$ will be high at the end of the conversion. It can be used to cascade two or more devices to increase resolution.
9	INT	INTERRUPT output. INT going low indicates the completion of a conversion. See Digital Interface section.	19	N.C.	Test Pin. Do not connect.
10	GND	Ground.	20	$V_{DD}$	Power supply voltage, +5V.

### Digital Interface

#### RD Mode (Pin 7 Low)

A conversion is started by taking  $\overline{RD}$  low and keeping it low until output data appears (Figure 1). Pin 6 ( $\overline{WR/RDY}$ ) is configured as a status output (RDY) in this mode, and is used with microprocessors which can be forced into a WAIT state. The processor starts a conversion, waits, and then reads data with a single READ instruction. RDY, an open collector output, goes low after the falling edge of  $\overline{CS}$  and goes high impedance at the end of the conversion. INT goes low at the end of the conversion and returns high on the rising edge of  $\overline{CS}$  or  $\overline{RD}$ .

#### WR-RD Mode (Pin 7 High)

In the WR-RD mode, pin 6 ( $\overline{WR/RDY}$ ) is the WRITE input for the converter. With  $\overline{CS}$  low, a conversion starts on the falling edge of WR. There are several options for reading data:

#### Using the Internal Delay

The processor waits for INT to go low before reading data (Figure 2). INT typically goes low 600ns after the rising edge of WR, indicating that the conversion is complete. With  $\overline{CS}$  low, DB0-DB7 are read by pulling  $\overline{RD}$  low. INT is then reset on the rising edge of  $\overline{CS}$  or  $\overline{RD}$ .

#### Reading Before Delay

The conversion time is externally controlled with  $\overline{RD}$  (Figure 3). The status of INT is ignored and RD is taken low as soon as 600ns after the rising edge of

WR. This completes the conversion and enables DB0-DB7. INT goes low after the falling edge of  $\overline{RD}$  and is reset on the rising edge of  $\overline{RD}$  or  $\overline{CS}$ .

#### Pipelined Operation

"Pipelined" operation is achieved by tying  $\overline{WR}$  and  $\overline{RD}$  together (Figure 4). With CS low, taking WR and RD low starts a new conversion and, at the same time, reads the result of the previous conversion.

#### Stand-Alone Operation

In stand-alone operation,  $\overline{CS}$  and  $\overline{RD}$  are tied low and a conversion is initiated by pulling WR low (Figure 5). Output data is valid approximately 600ns after the rising edge of WR.

### Analog Considerations

#### Reference Input

The  $V_{REF}(+)$  and  $V_{REF}(-)$  inputs of the converter set the full-scale and zero input voltages. The voltage at  $V_{REF}(-)$  defines the input level which produces an output code of all zeroes, and the voltage at  $V_{REF}(+)$  defines the input which produces an output code of all ones (see Figure 6). Figure 7 shows some reference configurations.

#### Bypassing

A  $47\mu F$  electrolytic and  $0.1\mu F$  ceramic capacitor should be used to bypass the  $V_{DD}$  pin to GND. The lead length of these capacitors should be as short as possible. If the reference inputs (pins 11, 12) are driven by long lines, they also should be bypassed to GND with  $0.1\mu F$  capacitors at the reference input pins.

### Input Current

The ADC0820 analog input behaves somewhat differently from conventional A/D converters. The ADC0820 takes varying amounts of current from the input depending on the operating cycle of the A/D.

During the input sampling phase (WR = LOW in the (WR-RD Mode) input capacitors must be charged to the input voltage through the resistance of internal analog switches (about  $2\text{k}\Omega$  to  $5\text{k}\Omega$ ). In addition, about  $12\text{pF}$  of stray capacitance ( $C_s$ ) must be charged. An equivalent RC model of the input is shown in Figure 8. The  $45\text{pF}$  input capacitance allows source resistances ( $R_s$ ) of up to  $1\text{k}\Omega$  to be used without increased settling time. For larger resistances, the width of the WR pulse must be increased from 600ns. In the RD mode, where the sample time is fixed,  $R_s$  greater than  $1\text{k}\Omega$  may cause settling errors. In this case, use the WR-RD mode and greater than 600ns RD time, or use a buffer to drive the analog input.

### Input Filtering

The ADC0820's sampled data comparators generate input transients at  $V_{IN}$ . This does not degrade performance since the A/D only "looks" at the input after these transients occur. It is not necessary to filter these transients with an external capacitor at the  $V_{IN}$  terminal.

### Inherent Track-and-Hold

The ADC0820 can measure a variety of high speed input signals without the help of an external sample-and-hold. The input is tracked from the time WR goes low (in the WR-RD mode) to approximately 100ns after it returns high. Input signals with slew rates typically up to  $200\text{mV}/\mu\text{s}$  can be converted without error.

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
